The oligonucleotide consists of a SalI site, Kozak's consensus sequence for efficient translation, an initiation codon, nucleotides encoding the peptide given in AAR57996, two stop codons, and a NotI site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                MHC class I; antigen; MAGE; melanoma; breast cancer; bladder cancer; Titermax; cytotoxic T-lymphocyte; tumour; pathogenic disease; bacteria; parasite; human; animal.
The sequences given in AAR83931-49 are MHC class I restricted 8-12 amino acid antigenic peptides. This peptide represents ovalbumin residues 257-264. These peptides may be administered to a subject in combination with a suitable adjuvant, pref. Titermax (RTM), to induce cytotoxic T-lymphocytes. This method may be used in the
                                                                                                                                              Cytotoxic T-cell induction by MHC class I-restricted peptide in adjuvant - useful for treating tumours and bacterial or parasit: pathogenic diseases
                                                                                                                                                                                                                                                        Dyall R,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          MHC class I restricted antigenic peptide #8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              05-JUN-1996

                            Peptides AAR89154-73 are examples of exogenous peptides which are "loaded" onto the antigen-presenting major histocompatibility complex (MHC) on the cell surface in a novel method of stimulating cytotoxic T lymphocytes. The method involves treating cells, e.g. at a pH 5 or below or pH 9 or above, to remove the endogenous peptides from the MHC, followed by recharging the complexes with specified exogenous peptides having the same allelic restriction as the MHC. The cells are pref. peripheral blood lymphocytes, spleen, ganglion or placental cells which are able to present the exogenous antigen in a native form. Recharged cells contain exogenous peptides at a higher density than native cells and are used to stimulate specific cytotoxic T lymphocytes in response to infections, tumours or autoimmune diseases. This peptide is derived from ovalbumin and belongs to the allelic restriction Kb. (Updated on 25-MAR-2003 to correct PI field.)
                                                                                                                                                                                                                                                                                                            Cell population with high surface density of exogenous peptide bound to MTC molecules - prepd. by stripping endogenous peptide and reloading exogenous peptide(s), useful for stimulating cytotoxic lymphocytes in cases of infection, tumour and auto-immune disease

                                                                                                                                                                                                                        Chicken OVA-peptide (AAW19955) is used in novel hybrid peptides, OVA-Bip (AAW19956) and Bip-OVA (AAW19957) which heat shock protein is Bip binding domain (see also AAW19951). The hybrid protein is combined in vitro with a HSP, such as hsp70, to form a complex that, when administered to a subject, induces an immune response. Vaccine compositions were prepd. by combining recombinant mouse hsp70, recombinant human hsp40 and Ova-peptide. Combinations of antigen with hsp70 or a mixture of hsp70 and hsp40 were effective
                                                                                                                                                                                                                                                                                                                                                                                                                         Hartl FU,

The peptides were tested for MHC specificity to find MHC I specific peptides. These peptides are useful for tissue typing or fo screening for molecules that interact with MHC class I molecules. MH class I molecules can be identified using the peptides and also the peptides are useful in vaccines against disease and infection e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Major histocompatibility complex; MHC; target; binding; tumour; cancer; neoplasia; LSTRA; EL-4; identification; detection; screening, tissue typing; Bcr-abl.

The method for the production of activated CD8+ T cells specifically CC directed towards a particular antigen involves affixing peptides CC corresponding to the particular antigen to an artificial support; CC cortexting macrophages with the affixed peptides for a time sufficient CC for the peptides to be engulfed, and at least a portion of the peptides CC to be presented on the surface of the macrophage; and contacting CC unprimed CD8+ T cells with the peptide presenting macrophages for a CC time sufficient to activate the unprimed CD8+ T cells. The present CC sequence represents a peptide designated OV8+ which corresponds to CC ovalbumin, a Kb-restricted peptide antigen. This is the optimal peptide. Small extensions to the optimal peptide affect the affinity CC of the peptide for soluble class I molecules in vitro e.g. the addition CC of two amino acids to the amino-terminus lowers the affinity to Kb by CC T6-fold compared to the optimal peptide; addition of two amino acids to the carboxy-terminus lowers the affinity by 4-fold. The method, CC macrophages and artificial antigen presenting cell, having a peptide CC corresponding to the particular antigen present in its interior, can be used to CC treat conditions (e.g. cancer, tumours, neoplassia, viral or retroviral CC infection or autoimmune or autoimmune-type conditions) in patients via CC the specific killing of target cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention. The specification describes a method for increasing the presentation of a peptide (antigen) on a mammalian cell. The method comprises inhibiting the activity of a transporter associated with TAP or proteasome in the cell in vitro before contacting the cell with the peptide. Antigen-presenting cells produced as above can be used to stimulate an immune response in vitro or in vivo e.g. to treat or prevent cancer or infection with a pathogen, e.g. a bacterium or virus. Cytotoxic T cells produced as above can also be used for therapy.
The present sequence represents residues 258-276 of the ovalbumin protein. The ovalbumin peptide was used in the method of the invention. The invention provides a method for delivering a moiety (e.g. ovalbumin protein) of interest into a cell which involves contacting the cell with a complex comprising the moiety of interest covalently linked to a heat shock protein (e.g. hsp70). The method is claimed to be useful for providing the efficient delivery into cells
                                                                                                                                                                                                                                                                                                                                        18-FEB-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match
                                                                                                     Peptides AAW68301-W68384 are examples of antigens (Ag) which can be loaded onto recombinantly produced major histocompatibility complex (MMC) molecules in a method of detecting antigen-specific lymphocytes. The MHC-antigen complex is then immobilised on a solid support and a sample containing cells recognising the MHC-Ag complex may be isolated. A similar method is used to isolate, purify or eliminate Ag-specific T-cells or to produce Ag-specific cytotoxic T-cells (CTC). The method is also used to detect and quantify tumour-specific T-cells and to generate CTC for specific killing of tumour cells (solid tumours, leukaemia or lymphoma) by injection into a human or animal, but also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of moieties which are not normally able to enter cells or which enter cells only to a limited extent. The method can be useful for delivering moieties such as proteins, peptides, lipids, glycoproteins, small organic molecules and other molecules, particularly chemicals and other molecules which are useful therapeutically or diagnostically. The method is claimed to be useful when applied to vaccination regimes,

                                                                                                                                                     Peptides AAW68301-W68384 are examples of antigens (Ag) which can be loaded onto recombinantly produced major histocompatibility complex (MHC) molecules in a method of detecting antigen-specific lymphocytes. The MHC-antigen complex is then immobilised on a solid support and a sample containing cells recognising the MHC-Ag complex may be isolated. This peptide is derived from amino acids 258-276 of ovalbumin. A similar method is used to isolate, purify or eliminate Ag-specific T-cells or to produce Ag-specific cytotoxic T-cells (CTC). The method is also used to detect and quantify tumour-specific T-cells and to generate CTC for specific killing of tumour cells (solid tumours, leukaemia or lymphoma) by injection into a human or animal, but also for treating vital infections
                                                                                                        Sequence
                                                                                                                                                                                                                                                                                                                       Disclosure; Page 29; 222pp; French.

                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence shown in AAW60683 to AAW60700 are epitope sequences of various cviral antigens used to exemplify the method of invention of immunising continuating the mammal against a target antigen. The method comprises continuating the mammal with a nucleic acid encoding a relevant epitope conditions of the mammal with a nucleic acid encoding a relevant epitope is conditionable of the infant mammal. The genetic immunisation of infant compressed in the infant mammal. The genetic immunisation of infant compressed in the infant conditionable of cytotoxic T lymphocytes) and humoral immune responses against the target contigen. The methods are particularly used for treating infants with compressed humoral responses, that have high-zone tolerances against the conditionable of target antigens or have a Th2 biased immune response. The target antigen conditions, e.g. a respiratory syncytial virus antigen, a condition of conditions and the condition of conditions antigen, a hepatitis virus antigen, a human immunodeficiency construs antigen, a hepatitis virus antigen, a hepatitis B virus antigen, a herpes simplex virus antigen or an influenza virus antigen, a bacterial consideration of streptococcus pneumoniae antigen, Hemophilus influenzae constituence constit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      OVA derived from ovalbumin was used in the production of soluble complexes. The pep-MHC (peptide-major histocompatibility) complexes, including both MHC heavy and light chains, bound to a c targeting molecule can be used to target a cytotoxic T cell to specific cells. This is particularly useful for targeting cells, specifically of the ovary or brain. The method can also to eliminate an entire cell type for example during bone marrow
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             8

                                              This sequence represents an ovalbumin-derived peptide antigen which is presented on major histocompatibility complex (MHC) Class I molecul of dendritic cells via the use of a novel process to improve soluble protein antigen presentation. This process uses dendritic cells which

Tumour cells from the host can be engineered to include ATA and therefore induce anti-tumour cytotoxic T Lymphocytes. This method can be used for the treatment and prevention of a wide range of tumours even when the tumour is inaccessible or where metastases are being targeted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inducing anti-tumour cytotoxic T lymphocytes with artificial antigen, then immunisation with modified in vitro to express the same antigen, of

The dendritic cells which result from the internalisation are characterised by MHC Class I and Class II molecules which have much longer half lives and greater stability than comparable dendritic cells which have not internalised such bacteria. The dendritic cells can be contacted with immunocompetent cells for stimulating an immune response. The dendritic cells can also be used to stimulate maturation of an immature dendritic cells can also be used to stimulate maturation of an immature dendritic
                                                                                                               The invention relates to conjugate peptides engineered to noncovalently bind to heat shock proteins (hsp). A method of identifying a hsp binding peptide comprises (a) contacting a phage display library having bacteriophage expressing, in a surface protein, inserted peptides with a hap target, and bound to a henzoquinone ansawycin antibiotic (BAA), in a physiologic binding buffer; (b) isolating a phage binding to the hsp target; and (c) identifying the inserted peptide expressed. The peptides which bind to a hsp can be used as tethering peptides for a hsp which may serve as an accessory in a chaperone process and/or may comprise a cytokine. They can also be coupled to antigens to induce an immune response. Such compositions can be used for treating neoplastic disease, e.g. cancers, infectious diseases, e.g. diseases caused by a bacterium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Hartl U,
Ouerfelli
                              disease of the immune system, e.g. acquired immune deficiencies autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SS
                           The invention relates to a dendritic cell-derived factor that restores composition and interferon gamma (IFNgamma) production to T cells from cc granulocyte macrophage colony-stimulating factor (GM-CSF). The dendritic ccell-derived factor which is a T cell stimulatory factor modulates the cresponse of GM-CSF on production of IFNgamma by lymphocytes and the cc response of GM-CSF on the cells to interleukin-2, and corrects the credity of the control of the credity of the credity of the cells to interleukin-2, and corrects the composition of the credity of the cells of the cell-derived factor is used in vivo to increase proliferation of T cells candor IFNgamma production, e.g. during immunisation to increase the cresponse to an antigen. Agents with T cell derived factor activity are cused to decrease production of IFNgamma, e.g. to reduce autoimmune cells of the cell derived factor activity are used to treat excessive/inadequate T cell cell or cell factor (or their fragments) can also be used to raise cell or in vitro studies. The present sequence represents an ovalbumin cell peptide fragment used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

                                                                                                                                                                                                                                                                                                              The invention relates to the preparation of a conjugate of a mutant major histocompatibility complex (MHC) class I molecule (containing a Tyr67Cys amino acid substitution in the beta2-microglobulin subunit) and a compound. This sequence corresponds to the ovalbumin-derived peptide OVA. The peptide is used as a control to prepare a hybrid peptide-MHC class I tetramer in which a mutant human beta2-microglobulin subunit binds a mouse MHC class I molecule. The conjugates are useful for stimulating immunity in an individual, and eradicating undesired cells
                        T-cell activation peptide #3
                                                                                                       AAW67585 standard;

peptides AAW67583-W67611 are used to produce activated T helper (CD4+) and cytotoxic (CD8+) T cells. The activated T cells are produced by treating peripheral blood lymphocytes with liposome-encapsulated peptide antigen to generate Ag-loaded antigen-presenting cells (APC), contacting naive or anergic T-cells with these APC, and isolating the resulting activated T-cells. The cells are specific for a particular antigen, particularly one derived from a tumour, but also those from viruses, particularly one derived from a tumour, but also those from viruses, particular and other parasites. It can also be used to identify antigens and epitopes able to generate an Ag-specific T-cell response (by assessing proliferation and cytokine release). Also the Ag-loaded APC can be used as cellular vaccines for treating cancer (claimed) or other diseases (a malaria human immune deficiency virus infection.
                                                                                         diseases (e.g. malaria, human immune deficiency virus infection, hepatitis, tuberculosis). The activated T-cells can be used to same conditions by adoptive T-cell transfer therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                           Method of activation of T cells - by cells loaded with antigen in liposome, cancer and microbial infections

The present sequence is one such target antigen used in the present invention. The present invention would be useful for providing an enhanced immune response to the present target antigen. The vector of the present invention may therefore be useful in immunotherapy for treating or preventing diseases caused by viruses, bacteria, protozoans, parasites, premalignant cells and tumour cells. The recombinant vector can be used to treat or prevent preneoplastic or hyperplastic states such as colon polyps, Crohn's disease, ulcerative colitis and breast lesions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Costimulatory molecules have important roles in T-cell active therefore the immune response. The present invention relates recombinant vectors which comprise of foreign nucleic acid se encoding at least three costimulatory molecules: a B7 family
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel recombinant vector useful as immunogens and vaccines for stimulating and enhancing immunological responses to target cells antigens expresses multiple co-stimulatory molecules such as B7-1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Schlom J,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   12-NOV-1999;

The telomerase antigens or vaccine compositions are useful for inducing a cytotoxic T-cell immune response against telomerase and hence against telomerase-expressing cells (i.e., cancer cells. Additionally, the telomerase antigen-primed APC may be coadministered with interleukin-2 for cancer treatment or prevention. The present sequence represents a peptide used in the exemplification of the invention in an assay of the cytotoxic activity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a human telomerase peptide antigen (AAB29461) which binds to a class I HLA (human leukocyte antigen, MHC, major histocompatibility complex), and to conservatively substituted variants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New telomerase-specific T-cell antigens useful for generating T-cell responses against telomerases and for producing vaccines for treating or preventing cancer by in vivo or ex vivo techniques
                                                                                                                                              Gilboa E,
                                                                                                                                                                                                                                                                  31-AUG-2000.
                                                                                                                                                                                                                                                                                                                           Unidentified
                                                                                                                                                                                                                                                                                                                                                                                    Tumour associated OVA peptide
                                                                                                                                                                                                                                                                                                                                                                                                                  16-JAN-2001

                                                                                                                                                                                                     The present invention relates to compositions of modified soluble protein antigens capable of eliciting an enhanced in vivo cytotoxic T cell (CTL) response i.e. a major histocompatability complex (MHC) class I molecule response. The protein antigen is modified by the covalent addition of a peptide sequence which facilitate entry of the antigen into antigen presenting cells (APCs). The present sequence is a peptide derived from the chicken antigen OVA. This peptide was used to prepare the modified antigens. The modified antigen composition may be used for immunising against, or treating a tumour e.g. prostate and breast carcinoma or multiple myeloma, or pathogen in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            response by administering a composition of a purified complex of calreticulin bound to an antigenic molecule. The present invention useful for prevention and treatment of cancer and infectious disection a vertebrate especially of humans. The present sequence is the tumour antigenic peptide OVA which was used in the invention.
                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Example 1; Page 10; 34pp; English.

RESULT 23
AAY68311
cc and N-termini respectively, via a nucleotide spacer sequence encoding a coplypeptide. (II) includes an antigen-binding site and when (II) and ct the antigen are associated they are recognized by a mammalian T cell creeptor (TCR). (I) are used to produce (II) which are used to study functional interactions between the various MHC domains. They can also cope used to modulate (in vivo or in vitro) the immune system by inducing cc an effector response (cytotoxicity, antibody synthesis, phagocytosis) cc dimmune system cells, typically for treating, or immunising against; cc cancer, acquired immune deficiency syndrome, lupus crythematosus, cmultiple sclerosis, toxic shock and snake bite, but also for selective destruction of autoreactive cells, diagnostically to assay T cell creceptors and to raise specific antibodies (useful for diagnosis, ct therapy, studying MHC-associated cellular processes and for affinity purification). AAZ57558 and AAX68186 to AAX68316 are sequences used in the composition of the present invention.
                                                                                                                                                                                                                                                                                                                                      The present invention describes a recombinant DNA molecule (I) containing a sequence (Ia) that encodes an altered MHC (major histocompatibility complex) Class I determinant (II) comprises a polypeptide with alpha1, alpha2, alpha3 and beta2-microglobulin domains, in which alpha3 and beta2 are covalently linked, thorough C-domains, in which alpha3 and beta2 are covalently linked, thorough C-domains.

                                                                                                                                                                                                                                                                               This sequence represents a fragment of the chicken ovalbumin.

CC The invention relates to a nonvirulent bacterium (I), comprising

CC a first gene encoding a nonsecreted foreign functional cytolysin operably

CC linked to a heterologous promoter which expresses cytolysin in the

CC bacterium and a second gene encoding a different foreign agent. The

CC bacterium can be used to deliver a wide variety of foreign agent. The

CC cutaryotic cells for applications such as diagnosis, therapy including

CC prophylactic treatments such as immunisations and gene therapy especially

CC for single gene disorders suitable for localised treatment and

CC biosynthesis. They can be used to deliver antigenic polypeptides

CC presented in association with major histocompatibility (MHC) proteins to

CC presented in association with major histocompatibility (MHC) proteins to

CC antigen-presenting cells. The bacterium can be engineered to deliver

CC libraries of agents for screening. The foreign agent can be delivered to

CC any target cell capable of carrying out endocytosis of the subject

CC invercells, pancreatic cells, neural cells, endothelial cells, muscle cells,

CC liver cells, pancreatic cells, neural cells, fibroblasts, tumour cells

CC acid and/or protein which is bioactive in and therapeutic to the target

CC eukaryote. Bacterium mediated delivery of protein does not require

CC cytosol of virtually all cells in culture. The process is rapid and

CC efficient and large enzymatically active proteins can be delivered.

CC encoded by the AOS minigene insert of the expression vector pMIN.0 CC (AAZ38634). This insert encodes several MHC class I epitopes, including this sequence, plus DNA encoding the universal MHC class I (helper T) epitope, pan DR epitope (PADRE), and was used CC class I (helper T) epitope, pan DR epitope (PADRE), and was used CC (in an exemplification of the present invention. The invention CC class I fusion gene encoding a major histocompatibility complex CC (MHC) targetting sequence, and two or more heterologous peptide CC epitopes. The MHC class I epitope to a cytosolic pathway or to the endoplasmic reticulum, or an MHC class I targetting sequence, which directs extracellular antigens to enter the endocytic pathway to compressed into antigen peptides for presentation on MHC class I molecules. The heterologous epitopes may comprise either helper T cC lymphocyte (HTL) epitopes, or a cytotoxic T lymphocyte (CTL) epitope and a universal HTL epitopes such as a pan DR epitope (PADRE). The vectors care useful for stimulating an immune response in vivo, as well as for use in assaying the human infectious pathogens, such as viruses (e.g., CC HIV, hepathtis B (HBV and hepathtis C (HCV)) bacteria, protozoa (e.g., Plasmodium falciparum, the cause of malaria) and also tumour cells and combined with other MHC class I and class II epitopes to increase the number of cells that are activated in response to a given antigen and comprise to a proven antigen and compress to increase the number of cells that are activated in response to a given antigen and compress the compression of the creative alleles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric; ovalbumin; pan DR epitope; expression vector; promoter; major histocompatibility complex; MHC; targetting; pegepitope; antigen; presentation; class I; cytosolic pathway; endoplasmic reticulum; class II; extracellular antigen; endocytic pathway; helper T lymphocyte; HTL; universal epitope; cytotoxic T lymphocyte; CTL; immune response; immunogenicity; acytotoxic T lymphocyte; CTL; immune verponse; immunogenicity; acytotoxic immunity; infection; pathogen; virus; HTV; HBV; HCV; hepatitis B; hepatitis C; bacterium; protozoan; tumour cell; autoimmune disease; activation; antiviral; antimalarial;

                         The present invention describes a composition capable of eliciting canti-major histocompatibility (MHC) annibodies. The composition comprises an antigen associated with an altered MHC Class II determinant (I) comprising alphal, alpha2, betal and beta2 polypeptide domains are encoded by a mammalian MHC Class II locus covalently linked to form a covalence. The resulting Antigen-MHC complex is recognizable by the T cell creceptor. The compositions are used for immunisation against, or covalence. The compositions are used for immunisation against, or covalent of, a wide range of autoimmune diseases, e.g. acquired immune covalence of the compositions are used for immunisation acquired immune covalence of the compositions are used for immunisation of the nature covalence of the compositions are used for immunisation of the nature covalities, toxic shock, tumour and snakebite, depending on the nature covalities, toxic shock, tumour and snakebite, depending on the nature covalities, toxic shock, tumour and snakebite, depending on the nature covalities, toxic shock, tumour and snakebite, depending on the nature covalities, toxic shock, tumour and snakebite, depending on the nature covalities are produced by usual methods of immunisation or cell fusion, and may be humanised by standard methods of immunisation or cell fusion, and may be humanised by standard methods. These antibodies are useful for covalities are useful for covalities and solution of MHC gene products), therapy covalities are useful for covalities and solution of the study of MHC and cellular processes. AAZ33240 to AAZ33242 and AAY52840 to AAY52970 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Best Local

                             I alpha chain, a beta-2 microglobulin molecule and an antigenic peptide CC bound in the MHC groove. Alternatively, the complexes may comprise an MHC CC class II alpha chain, an MHC class II beta chain, and an antigenic CC peptide bound in the MHC groove. The complexes are linked to the carboxyl terminus of the antibody. The compounds of the invention can be used as a C vaccine to modulate an immune response. The compounds of the invention CC are useful for treating: hyperproliferative disorders (e.g. neoplasms and CC hypergammaglobulinaemia); viral infections (e.g. hepatitis and gingivitis); meningitis; bacterial infections (e.g. theoreticus and gingivitis); CC parasitic infections, autoimmune diseases (e.g. Hashimoto's disease, CC Graves' disease and rheumatoid arthritis); allergic reactions/conditions (e.g. asthma). The compounds of the invention may also be used in the treatment of organ rejection or graft-versus-host disease (GVHD). The present amino acid sequence represents the ovalbumin 257-264 peptide, which was used as an antigenic peptide in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Best Local

                                                                                                                                                                                                                                                                                                      The present invention relates to a method for selecting a target polynucleotide. The method comprises introducing into a host cell population a library of insert polynucleotides, where expression of the target polynucleotide directly or indirectly promotes host cell death. The cells are cultured and the insert polynucleotides are collected from the cells which die. The method is useful for selecting target polynucleotides, particularly polynucleotides which alter cell phenotypes of induce or inhibit cell death. The method can be used to isolate toxic genes such as tumour suppressors. The present sequence was used to illustrate the method of the the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 1; Page 136; 359pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Selecting target polynucleotides, particularly toxic genes, involves introducing a library of insert polynucleotides into a host cell population, where the target polynucleotide promotes cell death -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   28-MAR-2000; 2000US-0192586.

An immunostimulatory fusion protein comprising the intracellular domain of HER-2 and an antigen elicits an immune response to the antigen and is useful for the treatment of associated cancer associated -

Example 1; Page 25; 59pp; English.

The invention relates to immunostimulatory fusion proteins (IFP) and nucleic acid molecules encoding such proteins. The IFPs comprise a polypeptide antigen component and an immunostimulatory component derived from the intracellular domain of HER-2 protein which is effective to elicit a protective dendritic cell (DC)-induced T-cell mediated cellular immune response to the antigen. IFP or superactivated dendritic cells are used to treat cancer e.g. breast carcinoma, ovarian and colon cancer associated with a particularly antigen. The present sequence is a ovalbumin (OVA)-derived immunodominant octapeptide. This peptide is used in the fusion constructs of the invention.

The peptides of the invention, fusion proteins comprising the peptide and conjugation compounds with carbohydrate polymers are used to induce a cell medial immune response against mucin in the prevention or treatment of carcinoma, preferably adenocarcinoma, most preferably breast cancer. They are also used in gene therapy. The present sequence is ovalbumin peptide from human. This sequence is used for the prediction of T-cell epitopes.
The present sequence represents an OVA-derived minimal CTL peptide, which was used in the course of the invention. The specification describes the use of the major OprI lipoprotein of Beudomonas aeruginosa or its functional fragments as an adjuvant to obtain
                                                                                                                   Use of major OprI lipoprotein of Pseudomonas aeruginosa or its functional fragments as adjuvant to obtain a Th1 type immune response against heterologous antigen, for treating leishmaniasis, leprosy,
                                                                                                                                                                                                                                                                                                                                                                                           Synthetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           a Th1 type immune response against a heterologous antigen. They are especially used as an adjuvant to obtain a Th1 type immune response against a heterologous antigen such as antigen gp63 of Leishmania major, for treating a disease such as leishmaniasis, TBC (undefined), leprosy, mycotin infection, allergic asthma or an autoimmune disease, in which the natural Th1 response is insufficient and/or in which the immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                        The present invention relates to a pharmaceutical composition which comprises an antigen, an immunogenic oligodeoxynucleotide containing cytosine-guanine dinucleotide (CpG) motifs (CpG-ODM) and a polycationic polymer. The composition is useful for making a vaccine to induce potent immune responses, or to decrease or ablate undesired immune responses. The present sequence, OVA257-264, is a peptide from chicken ovalbumin. This sequence was used as a peptide antigen in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Pharmaceutical composition useful for inducing immune response comprises antigen, immunogenic oligodeoxynucleotide containing cytosine-guanine dinucleotide motifs and polycationic polymer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         05-JAN-2001; 2001WO-EP00087
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              02-AUG-2001

                                                                                                                                                                                                                                                                                                                which is released from ovalbumin (Ova) upon cleavage of peptide P1 (AAU05197). The present sequence is described in an invention relating to a novel method of inducing a CDB+ cytotoxic T lymphocyte (CTL) response to a molecule in an individual by administrating a fusion molecule joined to a hsp, or an adenosine triphosphate (ATP) binding domain of a hsp. The method is particularly useful in inducing a CDB+ CTL response in an individual deficient in CD4+ T cells e.g. for treating an AIDS acquired immunodeficiency syndrome patient carrying the human immunodeficiency virus (HIV). The method is also useful for treating diseases that are caused by or associated with intracellular pathogens, and for treating cancer.
                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence represents a naturally occurring which is released from ovalbumin (Ova) upon cleavage of

                                                                                                                                                                                                                                                                                                                                                                                                                                              number of tumour cells in a host. In addition, recombinant flavivirus may be useful as a vaccine to provide immune protection against pathogens such as bacteria, viruses, fungi and parasites. Unlike other vectors which will produce only one cycle of antigen expression and/or which will stop expression without the intervention of the host immune system, recombinant flaviviruses continue to propagate until the immune system is sufficiently activated to halt the infection. This produces a stronger immune response against the exogenous antigenic peptide produced from the flavivirus as compared to the immune response that would be elicited using conventional expression vectors (e.g., a viral replicon). The present peptide sequence is chicken ovalbumin CTL epitope which is the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a replication-competent recombinant flavivirus (yellow fever virus-YFV) comprising an exogenous nucleic acid encoding ar exogenous polypeptide. The replication-competent recombinant flavivirus may be used to illicit an immune response to an antigen, e.g., tumour associated antigen (TAA) or a microbial pathogen antigen, in a mammalian host. Particularly, recombinant flavivirus is useful for reducing the

The peptides may be used therapeutically by administering the peptides to a patient having a need to induce a directed CDB+ T cell response. The peptide may also be used as a preventive measure to avoid a disease or condition, or to treat subjects already affilicted with a disease. The present sequence can be inserted near the lemA hydrophobic element, to create peptides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (ISS) of polynuclectides and antigens. The extent of conjugation affects the immunological properties (e.g. the extent of antigens-specific antibody formation, including Thi-associated antibody formation) so the conjugates are used for altering the type and extent of immune response. (I) and (II) have immunomodulatory, immunosuppressive and antiallergic activities, and can be used in the modulation of immune responses via the stimulation of Thi lymphocytes and Thi-associated cytokines, and CS suppression of Th2 lymphocytes and cytokines. The populations (I) and CC suppression of Th2 lymphocytes and cytokines. The populations (I) and CC in individuals e.g. for the treatment of an allergic condition. (I) and CC (II) may be used to modulate immune responses and therefore prevent contrially harmful reactions to antigens. The present sequence cc represents an ovalbumin (OVA) cytotoxic T lymphocyte (CTL) epitope
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The present invention relates to a vaccine composition comprising liposome prepared from the total polar lipids extract of an archaeobacterium and an accellular antigen, preferably an isolated outer membrane from a pathogen. The vaccine of the invention provien enhanced cytotoxic T lymphocyte response. The vaccine of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Vaccine; Antiviral; Antibacterial; Antiparasitic; liposome; archaeobacterium; cytotoxic T lymphocyte response;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Example 6; Page 69; 97pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            controlling
                                                                                                                                New vaccine comprising a liposome useful for conferring protective immunity against an intracellular pathogen -

                                         This invention relates to a method for enhancing an immune response to an antigen in a mammal. The method comprises administering a composition comprising the antigen, a penetration enhancer selected from lipophilic solvents, low-frequency ultrasound, electroporation, iontophoresis and intraspidermal delivery and an agent for enhancing Langerhans cell migration to an epidermal or mucosal site. The method can be used to enhance the immune response to tumours, viruses, bacteria and parasites. The present sequence represents a fragment of the chicken ovalbumin (OVA) protein. The peptide functions as a EG7-OVA tumour associated peptide antigen for CD8+ cytotoxic T lymphocytes. The peptide can be used in the method of the invention to enhance an immune response to the EG7-OVA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  is useful for conferring protective immunity against an intracellular pathogen. The present peptide: immunodominant CTL epitope of ovalbumin, was used to illustrate the present invention. This peptide was used to test for the ability of archaeosomes to induce CTL responses to

                                                                                                                                                                                                                                                         The present invention relates to a pharmaceutical composition comprising CC (a) an antigen; (b) an immunostimulating substance consisting of CC neuroactive compounds, hormones, compounds having growth hormone activity or their mixtures; and (c) a polycationic polymer. The composition is CC murine tyrosinase related protein-2 peptide (TRP-2 peptide; see CC AAB82064), was used. Mice were injected subcutaneously with either the CC TRP-2 peptide, TRP-2 peptide + human growth hormone (HGH), TRP-2 peptide cyserificed 10 days post injection, and mesenteric and inguinal lymph CC nodes were harvested. Lymphocytes were prepared from lymph nodes and were CC (the present peptide), with the same major histocompatibility complex CC (MHC) restriction serving as negative control. Spots representing single CC re-1s specific for the peptide used for re-stimulation were counted. No spots were detected when the ovalbumin derived peptide was used, while CC TRP-2 peptide + pR60 + HGH showed the highest number of spots or single T CC cells. The present peptide was also used as a control peptide for CC experiments with substance P (see AAB82070).
                                                                                                                                                                Query Match

                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                      χX
                                                                                                                                                                                                                                                                                                                                             The present invention describes a modified therapeutic peptide (I) CC comprising a therapeutically active amino acid region (III) and a CC reactive group (II) (e.g. succinimidyl and maleimido groups) attached to CC a less therapeutically active amino acid region (IV), which covalently CC bonds with amino/hydroxyl/thiol groups on blood components to form a CC peptidase stabilised therapeutic peptide composed of 3-50 amino acids. CC (I) are useful for modifying therapeutic peptides e.g. hormones, growth CC factors and neurotransmitters, to protect them from peptidase activity in vivo for the treatment of various disorders. Endogenous therapeutic peptides are not suitable as drug candidates as they require frequent CC peptides are not suitable as drug candidates as they require frequent CC deministration due to rapid degradation by peptidases in the body.

CC Modifying and attaching therapeutic peptides to albumin prevents or reduces the action of peptidases to increase length of activity (half CC life) and specificity as bonding to large molecules decreases.

CC AAB90829 to AAB92441 represent peptides which can be used in the CC exemplification of the present invention.
                                                                                                                                                                                                                                                    Matches

C. MHC class I or class I epicope, and flanking insertion ends. A
c transposase, such as the Cre recombinase protein, is expressed in trans
c from a plasmid, or can be included in the transposable element. The Cre
c recombinase loops out the intervening sequences containing the antibiotic
c resistance cassette. When the transposable element inserts within a gene,
c the resolved insertion places the MHC class I or class II epitope in
c trams with the gene. The transposable elements of the invention are
c useful for detecting an antigenic epitope of an intracellular bacterial
c pathogen, such as Salmonella sp. Mycobacterium tuberculosis and Listeria
c monocytogenes. Certain embodiments of the technology, termed
c disseminated insertions of class-I epitopes" (DICE-I; DICE-II for
c class II epitopes) allow the rapid and accurate identification of
c proteins involved in bacterial pathogenesis so that such proteins can
be used as vaccine and drug targets. Carrier vaccines may be generated
by infecting bacteria with a transposable element of the invention
                                                                                                                          Matches

The transposable elements of the invertion are able to introduce in-frame insertions throughout the chromosome of an intracellular bacterial pathogen. This systems "tags" the bacterial gene and resulting protein, allowing the identification of proteins secreted across the membranes of the eukaryotic cell infected by the bacterium. In one embodiment, the transposable elements contain an antibiotic resistance cassette, two minimal loxp recombination sites, an
                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                            which additionally comprises an antigen associated with a disease, preferably cancer or a viral or bacterial disease, operably linked to MHC epitope DNA of the transposable element. The present sequence represents an ovalbumin MHC class I epitope specifically claimed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transposable element for detecting an antigenic epitope of a pathogen, comprising 5' and 3' recombining sites, nucleic acid sequences encoding a selectable marker and major histocompatibility complex (MHC) epitope,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  WPI; 2001-031967/04.

                                                                                                                                                                                                                                                                                                                                  The present invention relates to a composition comprising recombinant modified vaccinia Ankara (MVA) virus expressing an HIV (human immunodeficiency virus) env, gag and pol gene or its modified gene for the production of an HIV Env, Gag and Pol antigen by expression from the recombinant MVA virus. The HIV env gene is modified to encode an HIV Env protein composed of gp120 and the membrane-spanning and ectodomain of gp41, but lacking part or all of the cytoplasmic domain of gp41. The composition or recombinant MVA virus is useful for boosting or inducing CD8+ T cell immune response in primates, particularly in humans. The composition may be used for preventing ADS (acquired immune deficiency syndrome) or other viral infections. Sequences of the invention are also used as vaccines. The present sequence is chicken ovalbumin peptide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                               Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New recombinant modified vaccinia Ankara (MVA) virus expressing HIV env, gag and pol genes, useful for boosting or inducing CD8 T cell immune responses in primates, e.g. humans, particularly for preventing AIDS or other viral infections -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modified vaccinia Ankara virus; MVA; HIV; human immunodeficiency virus; CD8+ T cell; immune response; acquired immune deficiency syndrome; AIDS viral infection; vaccine; immunostimulant; virucide; chicken.

The method comprises administering the polypeptide antigen or at least one variant which includes at least one first T-helper cell epitope that is foreign to the animal (foreign TH epitope) and is formulated with chitosan. The polypeptide antigen is weakly immunogenic or non-immunogenic. The invention is used as vaccine. The chitosan and polypeptide antigen or its variant are useful in the preparation of an immunogenic composition for inducing or enhancing an immune response, particularly CTL response, against the polypeptide or protein antigen. The method for inducing or enhancing an immune response is useful in treating or ameliorating cancer, e.g. prostate or breast cancer. The present sequence is ovalbumin CTL epitope used to illustrate the method

The method involves inoculating the infant with a nucleic acid encoding one or more relevant epitopes of one or more target antigens associated with the pathogen in a carrier, so that the relevant epitope(s) is expressed in the infant mammal. B- or T-cell epitopes may be used, and the pathogen may be a virus, bacterium, protozoan, fungus, yeast, or parasite. The method may reduce the need for subsequent boost administrations and may prevent the side-effects associated with live attenuated vaccines. Administration of multiple epitopes directed to antigens associated with more than one pathogen may provide an infant with a broader spectrum of protection, and may be a means for inducing an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           acids 257-264) This is a T-CTL epitope which, in the context of MHC Class II self antigens, may be recognised by a cytotoxic T-cell and thereby promote CTL-mediated lysis of cells comprising the target antigen. It is an example of T-cell epitopes which may be used according to the invention. The invention relates to immunising an infant mammal against a target antigen or inducing a cytotoxic T-cell response against a pathogen. The method involves inoculating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Immunizing an infant mammal against a target antigen or inducing cytotoxic T cell response against a pathogen in the mammal, compradministering nucleic acid encoding relevant epitopes of pathogen

                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                      cc a regulator polypeptide, whose expression induces activation of a target transcriptional regulatory region in a host cell. The method comprises cc polypeptide, introducing into the host cells capable of expressing the cc polypeptide, introducing into the host cells capable of expressing the cc polypeptide, introducing into the host cells capable of expressing the cc polypeptides introducing into the host cells. The target transcriptional cc regulatory region is operably associated with a polymucleotide and cc the next cells to exhibit a pre-determined modified phenotype and where the host cells to exhibit a pre-determined modified phenotype and where the host cells to exhibit a pre-determined modified phenotype and where the peptide is displayed on the surface of the peptide so that cc candidate peptide and a molecular scaffold fused to the peptide so that cc candidate peptide is displayed on the surface of the candidate regulator cc polypeptide. The methods are useful in selecting and/or screening cregulator molecules may be used (e.g. in gene therapy) for preventing or treating cancers (e.g. breast or ovarian cancer), cardiovascular diseases (e.g. arrhythmia, heart failure, ischaemia), obesity, neurodegenerative cd diseases (e.g. psoriasis), infections (e.g. obstaty, neurodegenerative cd callarge applications and in improving the performance of existing or cdevelopmental drugs. It may also be used in immunobiology, inflammation, according callator response and in biotechnology applications. The sequences contact in ABG92946-ABG93029 are examples of regulator polypeptides.
                                                                                                                                                                                                                         Query Match

The vector includes sufficient potyvirus nucleic acid sequence to permit viral replication and spread within a plant infected by the vector. The invention also relates to Zucchini yellow mosaic potyvirus (ZYMV) AGII strain CP and its corresponding nucleic acid sequence. The recombinant vector is useful for transtently expressing a portion of the heterologous peptide in a plant. It is also useful for infecting a cucurbit fruit, is useful as a source of material for vaccination, pharmaceutical or diagnostic application. The present sequence is a ovalbumin peptide used to fuse to the N-terminus of ZYMV AGII
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel recombinant vector useful for transiently expressing heterologous peptide in plant comprises potyvirus nucleic acid sequence and heterologous sequence inserted at amino terminus of potyvirus coat

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          vivo release comprising use of a polycationic compound. The compound is and a vaccine containing an antigen. The medicament with retarded in vivo release, and a vaccine containing an antigen. The medicament includes e.g. an allergen, a cytokine, a chemokine, an immunostimulatory nucleic acid, a cytotoxic or an anti-oligogenic drug or a compound needed for wound healing. The medicament prevents or ameliorates side effects of drugs, which are due to its too fast distribution of the drug throughout the body by exhibiting a retarded release of the drug from the site of administration. In the case of vaccine the compounds provide a depot, which allows a long lasting continuous and effective presentation of the antigen to the immune system to create a protective immunity. This sequence represents a chicken ovalbumin MHC class I restricted epitope used in the scope of the invention.

The medicaments include allergens, cytokines, chemokines, immunostimulatory nucleic acids, cytotoxic or antioligogenic drugs and compounds needed for wound healing. Cytotoxic or antioligogenic drugs and compounds needed for wound healing. The medicament acts locally at the site of administration, and lowers or completely eliminates inflammatory side effects of medicaments. Thus the medicament reduces the inflammatory potential of a medicament and allows the administration of medicaments that are usually not administered or only rarely administered due to their inflammatory side effects. The sequence presented is the OVA 257-264 peptide, a major histocompatibility complex (MHC) class I (H-2Kb) restricted epitope of chicken ovalbumin
                                                                                                                                                                                                                                                                                         Mutant major histocompatibility complex class I chimeric protein; MHC; lymphocyte; T-cell receptor; tissue sample; biopsy material; pathogen; bodily fluid; T lymphocyte; neoplastic cell; tumour cell; MHC antigen; virus; protozoan; bacteria; fungi; nematode; immune response; activator; enhancer; T cell activator; mouse; recombinant yeast cell; Kb; OVA; Ld;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      comprises (MIC) class I chimeric protein. The protein of the invention of comprises a portion mediating binding to surfaces of recombinant yeast cells and a portion comprising peptide binding region of MHC class I of protein, where the invention is improved in stability as compared with MHC class I chimeric protein which is not a mutant chimeric protein. The protein of the protein, further comprising a detectable label, is useful for the protein, further comprising a detectable label, is useful for the protein as cells, tissue sample, biopsy material or bodily fluids. The method is useful for detecting a Tymphocyte that is specific for a neoplastic cell, a tumour cell a virus-infected cell, a protozoan-cell aneoplastic cell, a bacterium-infected cell or a fungus-infected cell. The protein of the invention can be used to directly activate T cells, in corder to identify/screen for peptide-MHC antigens. The protein is also useful in activating T cells that participate in the removal of target cells including neoplastic cells and cells infected with pathogenic capents including viruses, protozoans, bacteria, fungi or nematodes. The protein is improved in stability as compared with MHC class I capents mich is not a mutant chimeric protein. The present amino acid compared with MHC class I capents in the present amino acid a bacteria capents amouse MHC peptide of the invention, as described as a mouse MHC peptide of the invention, as described as a mouse MHC peptide of the invention, as described capents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Best Loc

                     The present invention describes a therapeutic composition (I) comprising a dendritic cell (II), a yeast vehicle (III) and at least one antigen (IV), where (II) has been loaded intracellularly with (III) and (IV). (I) has immunostimulant, antibacterial, antifungal, virucide, antiprotozoal and cytostatic activities. (I) has many attributes that make it an ideal vaccine candidate, including ease of construction, low expense of mass production, biological stability and safety. No grossly adverse side effects of immunisation with whole yeast were apparent at the time of the initial vaccination or upon real administration. The composition provides a powerful strategy for the induction of cell-mediated immunity directed against a variety of infectious diseases and cancer targets. The present sequence represents a chicken OVA (ovalbumin) 257-264 peptide which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to identifying a tumour antigen that elicits a T cell response directed against the tumour. The antigen may then be used to vaccinate against cancers e.g. melanomas, bladder cancers, breast cancers, pancreatic cancers. The present sequence represents a chicken ovalbumin CTL epitope fragment.

                                                                                                                                         which comprises a mutation that disrupts the expression of the sifa gene can dexpresses a therapeutic heterologous peptide such as an antigen. The attenuated microorganisms are useful for manufacturing medicaments to treat or prevent a disease which can be treated by the heterologous product and to increase the MHC class I-restricted response in a patient, to deliver a therapeutic polynucleotide to a host cell to treat a disease which can be corrected by administering the polynucleotide and to cause an increase in the MHC class I-restricted response in a patient. They can be corrected by administering the polynucleotide and to cause a license useful to deliver heterologous antigens and allergens to a patient, such as hepatitis, herpes simplex and Malarial antigens. The method of the invention is useful for delivery of antienes encleotides or ribozymes in gene therapy. Sequences of the invention are also used as vaccines and in protein therapy. The present sequence is ovalbumin peptide (OVA 257-264) used to evaluate the ability of an arcC/sifA (B9H8) TML mutant to stimulate a MHC class I-restricted response to heterologous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           RESULT 54
                                                                                                                                                 Bordetella pertussis. The recombinant toxin, CyaAOVA, was used to immunise C57BL/6(H-2b) mice once i.v. CD4- and CD40-independent cytotoxic T lymphocyte (CTL) priming was observed in the absence of adjuvant. The invention relates to the novel use of Bordetella C CyaA as a proteinaceous vector for targetting a molecule of interest to the surface CD1Lb-expressing cells, especially dendritic cells and neutrophils. The molecule of interest is translocated in the cytosol to prime a CTL response. In a preferred embodiment, a permissive site. The peptide may be an intracellular bacterial cell, tumour, viral, fungal or parasite cell antigen (all claimed). Alternatively, a drug, especially an antiinflammatory, is chemically coupled to CyaA for drug delivery.

The method involves screening the products of an expression library generated from DNA/RNA of a cell expressing a target epitope with cytotoxic T cells generated against CC the cell to identify DNA clones expressing target epitope or providing CC cytotoxic T cells specific for a gene product differentially expressed by a cell and measuring the cross-reactivity of the cytotoxic T cells (C compared to the cytotoxic T cells expressing a target epitope in which the target epitope is identified as a gene product inducing cytotoxic T cells. The method is CC useful for identifying a target epitope or antigen specific for a tumour CC cell. The target cells against which it is destirable to induce cell-cell immunity. The antigen identified by the method is useful confident in immunogenic compositions and vaccine preparations to induce the cregression of tumours, cancers and infections in mammals. The invention CC also relates to vaccinia viral vectors which are useful for treating or capainst the tumour cells. They are also useful for immunity or capainst the tumour cells. They are also useful for community or capainst the tumour cells. They are also useful for immunity or capainst the tumour cells. They are also useful for immunity or comparison. The

The invention relates to a novel method for identifying cytokine secreting cells (especially ELISPOT assays) using a polycationic substance. The method is useful for identifying cytokine secreting cells. The cytokine may be selected from interleukins (IL), interferons (IFN),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Ovalbumin; cytokine; ELISPOT assay; polycationic substance; cytokine secreting cell; interleukin; IL; interferon; IFN; tumour necrosis factor; colony stimulating factor; enzyme-linked imunosorbent spot assay.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        effect compared to prior art compounds containing CpG motifs. The ODNs antigen or antigen fragment than the prior art compounds containing CpG motifs a given antigen or antigen fragment than the prior art compounds containing CpG. Using immunostimulatory oligonucleotides containing deoxyinosine reduces the induction of adverse side reactions, especially the induction of systemic TNF-alpha or interleukin-6. The immunostimulatory effect of the composition containing a polycationic polymer and an antigenic fragment was significantly higher than could be expected from the addition of the effects of each single component or even the addition of the effects of the ODN or the polycation with the antigen. The present sequence represents the ovalbumin (OVA) peptide used as an antigen in examples of the method of the invention.
Egyed A,

The invention relates to a method for preparing membrane vesicles (in particular exosomes) from a biological sample, comprising culturing a population of membrane vesicle-producing cells under conditions allowing the release of the vesicles, enriching the vesicles and treating the enriched biological sample by density cushion centrifugation. Immunogenic membrane vesicles are useful for producing an immune response in a
                                                                                                                                                                                                                                                                                                                                                                                                                dendritic cell; exosome; density cushion centrifugation; dendritic cell; MHC; major histocompatibility complex; CD1; tumour; immunotherapy treatment; cancer; infection; immune disease.
